5/4/16

Word-based Translation

Every French word is generated by an English word (or null)

Word-based Translation

Some English words align once

Word-based Translation

Some English words disappear

Word-based Translation

Some English words align multiple times

Word-based Translation

Some French words are null-aligned

Word-based Translation

Some French words are translated out of order

IBM models 1 and 2

Generative story

1. given an English sentence E whose length is l , choose length m of French sentence F
2. choose how to connect each position in F to a position in E
3. for each position in F , choose which word to place there

IBM1: uniform distribution over connections

IBM2: probability of a connection depends on the positions it connects and the lengths

Inference (IBM 1 and 2)

- Infer assignments for latent variables (alignment)

- Tractable

alignments are independent of one another

- Typical use
 - Estimation: expected alignments
 - Prediction: Viterbi alignments

Generation

When do we ever need to generate from our model?

we do not use our translation models to predict French given English, but rather as a component of a system designed to **predict English given French** (Brown et al., 1993)

Translation

$$P(E|F) \propto P(E)P(F|E)$$

Generation

Do you see a problem in generating from IBM1 or 2?

Generation

Do you see a problem in generating from IBM1 or 2?

- given a French sentence, there are too many English candidates (perhaps infinitely many)

Generation

Do you see a problem in generating from IBM1 or 2?

- given a French sentence, there are too many English candidates (perhaps infinitely many)
- the generative story does not account for all English words

Generation

Do you see a problem in generating from IBM1 or 2?

- given a French sentence, there are too many English candidates (perhaps infinitely many)
- the generative story does not account for all English words
- we model very little about English words

Generation

Do you see a problem in generating from IBM1 or 2?

- given a French sentence, there are too many English candidates (perhaps infinitely many)
- the generative story does not account for all English words
- we model very little about English words
 - how many deletions?

Generation

Do you see a problem in generating from IBM1 or 2?

- given a French sentence, there are too many English candidates (perhaps infinitely many)
- the generative story does not account for all English words
- we model very little about English words
 - how many deletions?
 - how many insertions?

Generative Story IBM_{≥3}: Given E

Mary | did | not | slap | the | green | witch

Generative Story IBM_{≥3}: Fertility

Mary	did	not	slap				the	green	witch
Mary	did	not	slap	slap	slap		the	green	witch

Generative Story IBM_{≥3}: NULL insertion

Mary	did	not	slap					the	green	witch
Mary	did	not	slap	slap	slap			the	green	witch
							NULL			

Generative Story IBM_{≥3}: Translation

Mary	did	not	slap				the	green	witch
Mary	did	not	slap	slap	slap		the	green	witch
						NULL			
Mary		no	dió	una	bofetada	a	la	verde	bruja

Generative Story IBM_{≥3}: Distortion

Mary	did	not	slap				the	green	witch
Mary	did	not	slap	slap	slap		the	green	witch
						NULL			
Mary		no	dió	una	bofetada	a	la	verde	bruja
Mary		no	dió	una	bofetada	a	la	bruja	verde

"Reverse" Generation Example

Mary no dió una bofetada a la bruja verde

Example and figures from
(Knight and Al-Onaizan, 1998) and (Knight and May, 2009).
